

PEST B GONE INC WILL BE PROVIDING TREATMENT FOR THE CONTROL OF  
MOSQUITO TREATMENT

RESIDENCE ON \_\_\_\_\_ BETWEEN 9 AM TO 5 PM.

**Prepare for mosquito treatment.**

**1. Locate Breeding Sites**

Identify areas where mosquitoes are breeding, such as standing water in ponds, bird baths, clogged gutters, or any containers that may hold water (like flowerpots, tires, and buckets).

**2. Check for Mosquito Activity**

Observe areas in your yard where mosquitoes are most active, particularly during early morning and late afternoon.

**3. Remove Standing Water**

Drain any standing water around your property. This can significantly help reduce breeding sites for mosquitoes.

**4. Trim Vegetation**

Mow your lawn and trim back bushes or shrubs, especially in shaded areas where mosquitoes like to rest.

**5. Prepare the Exterior**

Move Outdoor Furniture

If possible, move outdoor furniture, cushions, toys, and other items to allow access for treatment.

Cover Outdoor Pools

If you have a pool, consider covering it during the treatment process to prevent any chemicals from contaminating the water.

**Plan for Pets and Children**

**6. Relocate Pets**

Keep pets indoors or in a safe area away from treated spots during and shortly after the application of mosquito control measures.

Child Safety

Ensure that children are kept away from treated areas until the exterminator indicates it is safe to return.

**7. Provide Specifics**

Share your observations about mosquito activity and any areas where they seem to congregate.

**8. Cover or Move Items**

If you have any outdoor furniture or decor that cannot be moved, cover these items to protect them from the treatment.

**9. Close Windows and Doors**

Ensure that all windows and doors are closed before the treatment begins to prevent mosquitoes from entering your home.

## Post-Treatment Guidelines

### Monitor for Activity

After treatment, keep an eye on areas for any signs of mosquito activity. Report any persistent issues to Pest B Gone.

### Prevent Future Infestations

#### 1. Regular Maintenance

Conduct regular checks of your yard for standing water and other potential mosquito breeding sites. Drain or eliminate these whenever possible.

#### 2. Consider Seasonal Treatments

Discuss with the exterminator about the potential for ongoing treatments or preventative measures, especially during peak mosquito season.

#### 3. Eliminate Standing Water

##### Inspect Your Property:

Regularly inspect your yard for any areas where water may be collected, such as bird baths, plant pots, buckets, and gutters.

##### Drain Water Sources:

Empty and clean containers that hold water at least once a week. For bird baths, change the water regularly, preferably every few days.

Fill or Cover: Fill in any low areas in your yard that collect water and cover or store items that might collect rainwater.

#### 4. Modify Outdoor Lighting

##### Change Bulbs:

Replace standard outdoor lights with LED lights, which are less attractive to mosquitoes. Use yellow-toned bug lights for patios and outdoor areas.

#### 5. Maintain Environmental Awareness Seasons:

Community Efforts: Participate in local mosquito control initiatives and educate your neighbors about combating mosquitoes collectively.

Physical Barriers: Use “bug zappers” or mosquito traps around outdoor gathering areas to further control mosquito populations.

By implementing these prevention strategies, you can significantly reduce the risk of mosquito infestations around your home and create a more comfortable outdoor environment. If you have specific concerns about mosquitoes or pest control, please feel free to reach out to Pest B Gone Inc. for professional assistance.
